## Abstracts

The global UAV Based Laser Methane Leakage Detector market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The laser methane remote meter uses laser technology to determine the concentration of methane in the atmosphere by measuring the absorption intensity of laser light of a specific wavelength by the measured gas. The laser beam is launched into the atmosphere. After passing a certain distance, part of the energy in the laser beam will be absorbed by the matching methane molecules. The concentration of methane can be calculated based on the changes in the absorbed light intensity.

Drones provide a convenient platform that enables laser methane telemetry to quickly and flexibly cover a large area. This technology is widely used in oil and gas fields, natural gas pipelines, greenhouse gas emission monitoring and other fields, helping to monitor and control methane emissions in real time and efficiently.
