Abstracts

According to our (Global Info Research) latest study, the global UF Membrane Filter market size was valued at US\$ 477 million in 2025 and is forecast to a readjusted size of US\$ 696 million by 2032 with a CAGR of 5.2% during review period.

In 2025, global production of UF membrane filters reached 320,000 units, with an average selling price of USD 1,450 per unit, total production capacity of 380,000 units, and an average gross margin of 40%.

A UF membrane filter is a pressure-driven membrane separation device that uses ultrafiltration membranes as the core filtration medium. With typical pore sizes ranging from 0.01 to 0.1 micrometers, it effectively removes suspended solids, colloids, bacteria, some viruses, and macromolecular organic matter, while allowing water and small dissolved substances to pass through. UF membrane filters usually consist of membrane modules, housings, inlet and outlet connections, and backwashing structures, and can be used as standalone filtration units or as pretreatment for reverse osmosis and nanofiltration systems.

The upstream of UF membrane filters mainly includes suppliers of membrane materials (such as PVDF and PES polymers), membrane module manufacturers, and suppliers of housings, seals, and plastic or stainless-steel structural components. The midstream consists of UF membrane filter and water treatment equipment manufacturers responsible for product design, assembly, testing, and standardized production. Downstream customers mainly include municipal water and wastewater utilities, industrial users (such as electronics, food and beverage, pharmaceuticals, and chemicals), commercial buildings, and integrators of residential and small commercial

water purification systems.

The UF Membrane Filter market is an important segment within membrane separation and water treatment equipment, with demand mainly coming from household water purification, commercial water purification, municipal water supply, industrial wastewater treatment, food and beverage processing, pharmaceuticals, ultrapure water pretreatment for electronics, and seawater desalination pretreatment. UF membrane filters usually rely on the pore-size screening effect of ultrafiltration membranes to remove suspended solids, colloids, bacteria, macromolecular organic matter, and certain particulate contaminants from water while retaining dissolved minerals, making them widely used in safe drinking water, water reuse treatment, and front-end protection for reverse osmosis systems. As water quality safety requirements increase, industrial water-saving demand strengthens, and membrane material costs and system integration capabilities improve, UF membrane filters are seeing broader adoption in both point-of-use purification and engineering water treatment. Overall, market competition focuses on membrane material performance, fouling resistance, flux stability, cleaning recovery rate, service life, system integration capability, after-sales maintenance, and customized design for different water quality conditions.
