Abstracts

According to our (Global Info Research) latest study, the global UHV Suspended Insulator market size was valued at US\$ 409 million in 2025 and is forecast to a readjusted size of US\$ 534 million by 2032 with a CAGR of 3.9% during review period.

UHV Suspended Insulators are used in UHV DC and AC transmission lines to meet the needs of suspended conductors and insulation, and to ensure the safe and stable operation of transmission lines. It can adapt to extreme operating environments such as high humidity and high temperature of UHV transmission lines, and has the advantages of light weight, high strength and corrosion resistance.

The upstream industry mainly consists of three material systems: porcelain insulators rely on high-alumina bauxite, kaolin, and high-strength steel caps; glass insulators involve tempered glass raw materials and zinc-coated accessories; and composite insulators primarily require silicone rubber, epoxy resin fiberglass core rods, and end accessories. The purity and formulation stability of the materials directly determine the product's anti-aging and flashover resistance.

In 2024, global sales of composite insulators reached 5,300,000 units, with an average selling price of US\$75 per unit. The industry's gross profit margin is around 30%-40%.

The driving factors mainly stem from the profound adjustment of the national energy structure and the continued efforts of the 'new infrastructure' strategy. In order to achieve the 'dual carbon' goal, the transmission of electricity from large-scale wind and solar power bases is highly dependent on the construction of ultra-high voltage direct current (UHVDC) channels, which provides a certain incremental market for suspension

insulators. Meanwhile, the global construction of the energy internet and the grid upgrade needs of countries along the Belt and Road Initiative (such as localized cooperation in Middle Eastern markets like Saudi Arabia) have opened up overseas profit opportunities for Chinese companies with international competitiveness. Furthermore, the implementation of a full life-cycle green management system by power grid companies has prompted the industry to accelerate the research and development of lower-carbon and environmentally friendly manufacturing processes, such as reducing drying shrinkage rates through optimized molding processes and promoting closed-loop management of recyclable resources.
