Abstracts

The global Ultra Fine Aluminium Hydroxide market size is expected to reach \$ 2081 million by 2032, rising at a market growth of 6.8% CAGR during the forecast period (2026-2032).

Ultra Fine Aluminium Hydroxide is a fine-particle inorganic aluminum hydroxide powder, also known as ultra-fine ATH or alumina trihydrate, generally produced through precipitation, grinding, classification, surface treatment, or modification processes to achieve small particle size, narrow particle-size distribution, high whiteness, low impurity content, and good dispersion in polymer systems. It is mainly used as a halogen-free flame retardant, smoke suppressant, functional filler, and performance additive in wire and cable compounds, engineering plastics, rubber, coatings, adhesives, electronic materials, artificial stone, and composite materials. In 2025, global Ultra Fine Aluminium Hydroxide production reached approximately 1370 K MT.

The Ultra Fine Aluminium Hydroxide market is mainly driven by the transition from halogenated flame retardants to halogen-free, low-smoke, and low-toxicity flame-retardant systems. ATH decomposes endothermically at elevated temperature and releases water vapor, which helps cool the polymer matrix, dilute combustible gases, and suppress smoke generation. This makes it particularly suitable for low-smoke halogen-free wire and cable compounds, building materials, rubber, thermoplastics, and thermoset composites where fire safety, smoke density, corrosion control, and environmental compliance are increasingly important.

A second major growth driver is the higher performance requirement of downstream polymer compounding. Ordinary coarse ATH can reduce mechanical strength, increase viscosity, and worsen processability when added at high loading levels. Ultra fine and

surface-treated ATH improves dispersion, interface compatibility, filler loading, tensile properties, extrusion smoothness, and product appearance, making it more suitable for EVA, PE, PP, PVC, silicone rubber, epoxy, unsaturated polyester, and high-end composite systems. Demand is especially strong in cable sheathing, photovoltaic cable, charging pile cable, electronic insulation, automotive interiors, and flame-retardant construction materials.

The market is also supported by the expansion of China's fine alumina supply chain and the localization of high-performance inorganic flame retardants. China has large upstream alumina and aluminum hydroxide capacity, and companies such as Zhongchao, Chalco, Zhongshun, Pengfeng, Taixing, Linjia, and Jianzhan are improving particle-size control, surface modification, low-sodium control, and application-specific grades. As downstream users seek lower-cost alternatives to imported products while still meeting UL, IEC, RoHS, REACH, low-smoke halogen-free and automotive material requirements, Chinese ultra fine ATH suppliers are expected to gain more share in both domestic and export markets.
