## Abstracts

According to our (Global Info Research) latest study, the global Ultra-High Frequency (UHF) Tag Antennas market size was valued at US\$ 2563 million in 2024 and is forecast to a readjusted size of USD 4545 million by 2031 with a CAGR of 9.1% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Ultra-high frequency (UHF) tag antennas are a type of radio frequency identification antennas that usually operate in the range of 860 MHz to 960 MHz and are used to read and identify RFID tags at long distances. Compared with low-frequency (LF) and high-frequency (HF) antennas, UHF tag antennas have faster data transmission speeds, longer reading distances (up to 10 meters or even farther), and higher multi-tag recognition capabilities. They are widely used in supply chain management, warehousing and logistics, retail anti-theft, vehicle identification, manufacturing tracking and other scenarios that require batch identification and long-distance communication. UHF tag antennas can be divided into two types: near-field and far-field, which are suitable for different distances and application requirements, and are important technical components for achieving efficient and intelligent asset management.
