Ultra High Purity (UHP) Krypton refers to krypton gas refined to purity levels exceeding 99.999%, minimizing impurities such as nitrogen, oxygen, or hydrocarbons. Extracted via fractional distillation of liquefied air, it undergoes additional purification through gettering or adsorption to achieve parts-per-billion (ppb) contaminant levels. UHP Krypton's inertness and unique spectral properties make it critical in laser technologies (e.g., excimer lasers for semiconductor lithography), high-efficiency lighting (e.g., halogen lamps), and thermal insulation for double-pane windows. In aerospace, it serves as a propellant in ion thrusters due to its high density and non-reactivity. Strict handling protocols are required to maintain purity during storage and delivery, often using electropolished stainless steel cylinders.
