According to our (Global Info Research) latest study, the global Ultra-supercritical Units market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Ultra-supercritical power generation technology is a technology that increases the water vapor pressure and temperature above supercritical parameters to significantly improve the thermal efficiency of the unit and reduce coal consumption and pollutant emissions. It is one of the main technologies for thermal power energy conservation and emission reduction. Ultra-supercritical units mainly refer to ultra-high parameter coal-fired thermal power units with steam pressure of 25MPa and temperature above 580°C. Their power generation efficiency ranges from 43.8% to 45.4%, which is much higher than the 37.5% of subcritical units. The advantage of ultra-supercritical units is to further open up room for reduction in coal consumption per unit of electricity, which is an important direction for the technological upgrading of thermal power stations.
