Ultrasonic Anti-corrosion Liquid Level Gauge is a digital level instrument controlled by a microprocessor. During the measurement process, pulsed ultrasonic waves are emitted by sensors (transducers), and the sound waves are reflected off the surface of the object and then received by the same sensor, which converts them into electrical signals. By calculating the time between the emission and reception of sound waves, the distance between the sensor and the object being measured can be determined, thereby achieving the measurement of liquid level. Due to the use of non-contact measurement methods, the measured medium is almost unrestricted and can be widely used for measuring the height of various liquid and solid materials. The anti-corrosion ultrasonic level gauge uses probes made of special materials (such as PVDF) to ensure reliable operation of the instrument in corrosive liquids or environments, and to prevent corrosion and aging for a long time.
