According to our (Global Info Research) latest study, the global Ultrasonic Atomization Transducer market size was valued at US\$ 391 million in 2024 and is forecast to a readjusted size of USD 593 million by 2031 with a CAGR of 6.2% during review period.

Ultrasonic atomization transducer is a device that uses the ultrasonic principle to atomize liquid into tiny particles. Its core technology relies on the piezoelectric effect or mechanical vibration principle. When ultrasonic waves are transmitted to the liquid, the surface of the liquid will vibrate violently, forming extremely fine droplets or atomized particles. In this way, the molecules of the liquid can be dispersed in a very fine form, usually at the micron or even nanometer level.
