Abstracts

The global Ultrasonic Flosser market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The ultrasonic flosser uses the cavitation effect of ultrasonic waves in water to impact and separate the dirt on the tooth surface, and finally make the dirt layer fall off, which is the real ultrasonic cleaning. Without excessive flushing pressure, the cleaning effect is good, easy to operate and will not damage the gum tissue. The design of the ultrasonic system is simple and reliable, and the attenuation of ultrasonic waves is also minimal. The water outlet parts can be replaced, which can keep clean and hygienic.

This report studies the global Ultrasonic Flosser production, demand, key manufacturers, and key regions.
