Ultrasonic indium coating equipment is a device that uses the principle of ultrasonic vibration to accurately coat indium materials on the target surface. The equipment uses high-frequency ultrasonic vibration to form tiny bubbles of indium materials in the liquid medium, and under the action of ultrasonic cavitation effect, indium particles are evenly deposited on the surface of metal, ceramic or other substrates to form a coating with high uniformity and precision. Ultrasonic indium coating technology is widely used in the manufacture of electronics, optoelectronics, sensors and high-precision components, and is particularly suitable for coatings with high conductivity and corrosion resistance.
