Ultrasonic liquid treatment equipment is a device that uses the principle of ultrasonic wave to treat liquids. It produces cavitation effect through high-frequency oscillation of ultrasound, thereby achieving multiple functions such as cleaning, emulsification, dispersion, reaction acceleration, and degassing of liquids. The equipment usually includes an ultrasonic transducer, a generator, and a treatment tank, which can generate tiny bubbles in the liquid. These bubbles release huge energy when they collapse quickly, creating a high temperature and high pressure environment, thereby efficiently promoting the mixing, decomposition or cleaning of substances. Ultrasonic liquid treatment is widely used in chemical reactions, food processing, pharmaceutical manufacturing, environmental protection, precision cleaning and other fields, with the advantages of non-contact, uniform processing, energy saving and environmental protection.
