According to our (Global Info Research) latest study, the global Ultrasonic Osteogenesis Stimulator market size was valued at USD 260.3 million in 2022 and is forecast to a readjusted size of USD 384.8 million by 2029 with a CAGR of 5.7% during review period.

Bone growth stimulation, or BGS, is a form of therapy often used to promote healing after a spinal fusion surgery or fracture. BGS may promote faster natural healing in fractures that may be slow to heal on their own. Ultrasound is transmitted from a device and with a coupling gel applied to the skin over the site of the fracture. Ultrasound produces a wave, which sends a signal that applies a pressure to the bone. Bone growth stimulation is thought to result from this pressure, which is similar to mechanical pressure put on the bone.
