This report focus on Ultrasonic Passivation Systems. Ultrasonic Passivation Systems are used to perform the following operations: cleaning-rinsing-passivation-rinsing-drying. Passivation is a non-electrolytic process typically using nitric acid to remove free iron from the surface and form an inert, protective oxide layer that strengthens metals against rust and oxidation, making it a preferred method of corrosion control for many industries. Ideal for the medical device and aerospace industries, our processes and equipment are manufactured to the highest industry standards. Any industry that requires contaminate-free, corrosion-resistant parts and components can reap the benefits of having high quality Passivation Process Line.

According to our (Global Info Research) latest study, the global Ultrasonic Passivation Systems market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The ability of stainless steel to resist corrosion and maintain its mechanical properties under a wide range of stresses and temperatures makes it indispensable. In many fields, corrosion is an enormous cost and safety concern. Reducing rust is the main driver of the industry.
