The global Ultrasonic Personal Air Sampler market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Ultrasonic Personal Air Sampler is a device that collects airborne particles on a filter media and measures the mass concentration of particulate matter in the air. It uses an ultrasonic piezoelectric pump to drive the air flow, which makes it smaller, lighter, quieter, and more durable than conventional air sampling equipment. It also has various sensors and features that allow for wireless setup, GPS tracking, data logging, and flow control. It is designed to be worn directly in the breathing zone of a person or placed in a fixed location for stationary monitoring.

This report studies the global Ultrasonic Personal Air Sampler production, demand, key manufacturers, and key regions.
