## Abstracts

The global Ultrasound Imaging System market size is expected to reach \$ 19070 million by 2032, rising at a market growth of 7.4% CAGR during the forecast period (2026-2032).

An Ultrasound Imaging System is a medical diagnostic device that uses high-frequency sound waves to create live images of the inside of the body. It's commonly referred to as sonography or ultrasound scan, and it is widely used because it is non-invasive, safe, and real-time. In 2024, global Ultrasound Imaging System production reached approximately 417.6 k units , with an average global market price of around k US\$ 25.12 per unit.

Modern ultrasound machines increasingly offer 3D and 4D imaging capabilities, especially for obstetric and gynecological use. Additionally, electrography—used to assess tissue stiffness—has gained traction in liver disease evaluation and cancer diagnostics, offering more comprehensive imaging data.

Telemedicine and remote diagnostics are becoming increasingly important, particularly after the COVID-19 pandemic. Tele-ultrasound enables healthcare professionals to remotely perform or guide ultrasound examinations, improving access to quality diagnostics in underserved areas.

The integration of emerging technologies with ultrasonic imaging equipment has paved the way for advancements in portability and functionality. Miniaturized, portable, and handheld ultrasound devices offer numerous benefits, including enhanced mobility, high-quality imaging capabilities, complete functionality, and the ability to cater to diverse healthcare needs. These devices have the potential to revolutionize ultrasound

practices, enabling medical professionals to perform examinations conveniently and accurately across various clinical scenarios.
