According to our (Global Info Research) latest study, the global Ultraviolet Curing Coatings market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The ultraviolet curing, is also known as UV curing, a photochemical process of instantly curing or drying the inks, coatings or adhesives by using high intensity ultraviolet light. The UV coatings have many advantages over the traditional curing and drying methods such as PVC coatings.

The improved performance and advantages of UV curing coatings as the major factors have a positive impact on the market's growth during the next few years. UV curing coatings act as a protective layer in metal coatings and conformal coatings and aids in the prevention of the fading of the top layer due to prolonged exposure to sunlight. UV curing coatings use UV radiation in the drying process since it does not use heat for curing process. Additionally, it also does not release harmful particles such as VOC or hydrocarbons.
