## Abstracts

An LED is a semiconductor device/light source that emits visible light or infrared light when an electric charge passes through it. LEDs are primarily used in indicator lamps and for other types of lighting such as that used in billboard signs, TV remotes, and brake lights of vehicles. Initially, LEDs would only emit a low-intensity red light. Currently, however, LEDs are available across the visible, ultraviolet, and infrared wavelengths. They work on the principle of electroluminescence, wherein the color of illumination is determined by the energy band gap of the semiconductor. A UV LED displays an ultraviolet light; its wavelength is less than 400 nm.
