According to our (Global Info Research) latest study, the global Ultraviolet LED Technology market size was valued at USD 111.4 million in 2023 and is forecast to a readjusted size of USD 428.3 million by 2030 with a CAGR of 21.2% during review period.

An LED is a semiconductor device/light source that emits visible light or infrared light when an electric charge passes through it. LEDs are primarily used in indicator lamps and for other types of lighting such as that used in billboard signs, TV remotes, and brake lights of vehicles. Initially, LEDs would only emit a low-intensity red light. Currently, however, LEDs are available across the visible, ultraviolet, and infrared wavelengths. They work on the principle of electroluminescence, wherein the color of illumination is determined by the energy band gap of the semiconductor. A UV LED displays an ultraviolet light; its wavelength is less than 400 nm.

The UV LED market is expected to grow with new applications such as disinfection, that is, air and water purification system which works on UV-C technology. New technological advancements such as replacement of mercury lamp, flux density, and high performance with the high wavelength are also fostering the growth of the UV LED market. One of the emerging trends with respect to the industrial application of UV LED is the growing demand for UV curing solutions that integrates coating, printing, and adhesives and the evolution of UV lamps to UV LED.
