## Abstracts

Ultraviolet optics are designed specifically to work with light in the ultraviolet (UV) spectrum, typically wavelengths from about 10 nm to 400 nm. These optics are crucial in applications that require the manipulation or detection of UV light, such as photolithography for semiconductor manufacturing, forensic analysis, sterilization and disinfection, and UV spectroscopy for chemical analysis. Ultraviolet optics include lenses, mirrors, filters, and prisms made from materials that have high transmission rates in the UV range, such as fused silica, calcium fluoride (CaF<sub>2</sub>), and magnesium fluoride (MgF<sub>2</sub>). The design and manufacturing of UV optics demand strict material selection and precision to ensure high performance and durability, especially when used in environments where high-energy UV radiation could cause damage or degradation to lesser materials.

According to our (Global Info Research) latest study, the global Ultraviolet Optics market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
