According to our (Global Info Research) latest study, the global Ultraviolet Ozone Systems market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

An Ultraviolet Ozone System is a type of ozone generator that utilizes ultraviolet light to generate ozone. This type of ozone generator does not require a corona discharge or electrolysis process, as ozone is directly produced through the exposure of oxygen (O₂) or air to UV light.

The Ultraviolet Ozone System typically consists of a UV lamp or multiple UV lamps enclosed in a chamber. The UV lamp emits ultraviolet light, typically in the UV-C range, which has a wavelength of 200 to 280 nanometers. When oxygen or air passes through the chamber and is exposed to the UV light, a portion of the oxygen molecules are converted into ozone molecules (O₃).

UV ozone generators are known for their compact size, simplicity, and low maintenance requirements. They do not require additional chemicals or feed gas and can efficiently generate ozone without producing nitrogen oxides (NO_x) as byproducts.

These ozone generators are commonly used in applications where low to

moderate ozone concentrations are required, such as water purification, air treatment, and odor control. They are often used in situations where a continuous and reliable supply of ozone is needed.
