Abstracts

According to our (Global Info Research) latest study, the global Umbilical Cord Blood Stem Cells Storage market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

Umbilical Cord Blood Stem Cells are called 'zero-year-old cells'. They can systematically improve the functions of various organs and have extremely strong regeneration and repair capabilities. They can replace bone marrow for stem cell transplantation and treat blood and immune deficiency diseases such as leukemia and aplastic anemia. Currently, Umbilical Cord Blood Stem Cells can be used to treat more than 80 diseases in medicine.

Mesenchymal stem cells are widely present in human tissues and organs, especially in fetal perinatal tissues (placenta, umbilical cord, etc.). They are very abundant and have very low immunogenicity. And because neonatal stem cells are mainly derived from the placenta and umbilical cord, they are convenient and simple and will not cause harm to the mother and fetus. Because they are less contaminated, they are more pure and more active. In addition to having the common properties of stem cells, mesenchymal stem cells are less immunogenic and are a good choice for transplantation treatment. In addition, the 'regenerative properties' and 'healing properties' of mesenchymal stem cells have brought new light and hope to the treatment of human diseases. Due to their unique advantages, mesenchymal stem cells have become a potential stock in the treatment of various clinical diseases and are deeply affecting the development of modern medicine.
