## Abstracts

The global Underground Toilets market size is expected to reach \$ 2018 million by 2032, rising at a market growth of 5.9% CAGR during the forecast period (2026-2032).

Underground toilets are public health facilities built underground, typically located in high-traffic areas such as city squares, parks, subway stations, and commercial districts. They connect to the surface via entrances and exits and are equipped with basic infrastructure such as ventilation systems, drainage systems, lighting, handwashing stations, and toilets (either Western-style or squat toilets). Some high-end models also feature automatic cleaning systems, contactless sensor devices, smart lighting, and air purification systems. The biggest advantages of underground toilets are saving surface space, reducing visual pollution, and providing a discreet, all-weather environment, making them particularly suitable for urban centers or historic districts where aesthetics are important. The average price of this product is approximately US\$8,000 per unit, with global sales of approximately 166,000 units.

This report studies the global Underground Toilets production, demand, key manufacturers, and key regions.
