According to our (Global Info Research) latest study, the global Underwater Hull Cleaning Robot market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

An underwater hull cleaning robot is an autonomous or remotely operated robotic device designed to clean the hulls of ships, boats, and underwater structures. The hull of a vessel is the part that comes into direct contact with water, and over time, it can accumulate marine growth such as algae, barnacles, and other biofouling organisms. This growth can increase drag, reduce fuel efficiency, and impact the vessel's overall performance. Underwater hull cleaning robots are developed to address these issues by efficiently and effectively cleaning the hull without the need for dry-docking or manual intervention.
