## Abstracts

The global Underwater Salvage Services market size is expected to reach \$ 484 million by 2032, rising at a market growth of 4.2% CAGR during the forecast period (2026-2032).

Underwater salvage services refer to systematic engineering operations that utilize specialized diving techniques, equipment, and engineering methods to search for, locate, lift, and recover sunken objects or remains in underwater environments. Its core objective is the safe and efficient restoration of underwater targets. The service scope is broad, including the salvage of shipwrecks (whole or sections), crashed aircraft, lost cargo, critical equipment, and vehicles, as well as underwater archaeology, rescue, and environmental cleanup (such as sunken oil tanks). The operational process typically encompasses preliminary surveying, scheme design, underwater processing (such as threading slings and cutting), lifting out of the water, and subsequent transportation and delivery. This is a high-risk, high-tech professional service that integrates marine engineering, diving operations, lifting technology, and project management.

As the global marine economy continues to develop and humans increasingly utilize marine resources, the demand for underwater salvage services is likely to increase accordingly. For example, the frequent occurrence of vessel accidents in waters, the protection of underwater cultural heritage, and the prosperity of the aquaculture industry may all create demand for underwater salvage services. With the continuous advancement of science and technology, underwater salvage technology will be improved, making salvage work more efficient and safer. For example, the development of submersible technology and advances in remote control technology are expected to promote the development of underwater salvage services.
