According to our (Global Info Research) latest study, the global Unidirectional Multiport Optical Circulator market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The unidirectional multiport optical circulator is an optical device that realizes unidirectional transmission of optical signals between different ports, usually with three or more ports. Its working principle is to distribute input optical signals to different output ports according to fixed paths, while ensuring one-way transmission of optical signals between different ports to avoid reflection and interference of optical signals.

In a unidirectional multiport optical circulator, optical signals can be transmitted between different ports in a preset direction. Through its special design and working principle, unidirectional transmission and control of optical signals between different ports are achieved. It provides important support for the stable operation and efficient transmission of optical fiber communication systems.
