Abstracts

The global Unidirectional Multiport Optical Circulator market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

In a unidirectional multiport optical circulator, optical signals can be transmitted between different ports in a preset direction. Through its special design and working principle, unidirectional transmission and control of optical signals between different ports are achieved. It provides important support for the stable operation and efficient transmission of optical fiber communication systems.

The unidirectional multiport optical circulator is an optical device that realizes unidirectional transmission of optical signals between different ports, usually with three or more ports. Its working principle is to distribute input optical signals to different output ports according to fixed paths, while ensuring one-way transmission of optical signals between different ports to avoid reflection and interference of optical signals.
