A data diode is hardware device that is often called a 'unidirectional security gateway'. It is placed between two networks with different levels of security and controls the flow of information. A data diode is a cybersecurity solution that makes sure that information can only travel in one direction.

The Unidirectional Security Gateway market has several drivers that contribute to its growth and adoption. A data diode is a unidirectional network device that allows data to move only in one direction, preventing any possibility of information leakage or cyberattacks. With the growing frequency and sophistication of cyber threats, organizations are increasingly concerned about protecting their sensitive data from unauthorized access, data breaches, and cyberattacks. Data diodes provide an effective solution by creating an air gap, allowing data to flow securely in one direction only.
