## Abstracts

The global Unified Identity and Access Management System market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Identity and Access Management (IAM for short) is a security discipline that enables the right entities (people or things) to use the right resources (applications or data) when they need them, and to use what they want without interference equipment. IAM consists of the systems and processes that allow IT administrators to assign a single digital identity to each entity, authenticate them at login, authorize them to access specified resources, and monitor and manage those identities throughout their lifecycle.

IAM is no longer just for employees. Organizations must be able to provide secure access to contractors and business partners, remote and mobile users, and customers. With digital transformation, identities are also assigned to Internet of Things (IoT) devices, bots, and pieces of code such as APIs or microservices. Multi-cloud hybrid IT environments and software-as-a-service (SaaS) solutions further complicate IAM environments.

Because it sits between users and critical enterprise assets, identity and access management is a critical component of any enterprise security program. It helps prevent compromised user credentials and easily cracked passwords, common network entry points for criminal hackers looking to plant ransomware or steal data.

When implemented properly, IAM helps ensure business productivity and the smooth functioning of digital systems. Employees can work seamlessly no matter where they

are, while centralized management ensures they only have access to the specific resources they need to do their jobs. Opening up systems to customers, contractors, and suppliers increases efficiency and reduces costs.
