According to our (Global Info Research) latest study, the global Unipolarized Beamformer market size was valued at US\$ 194 million in 2024 and is forecast to a readjusted size of USD 294 million by 2031 with a CAGR of 6.2% during review period.

A single-polarization beamformer is a device or technology used in wireless communication systems that adjusts and combines the phase and amplitude of signals from one or more antenna arrays to generate a focused beam pointing in a specific direction. This technology focuses on a single polarization mode (such as horizontal polarization or vertical polarization) to improve the directivity and gain of the signal while reducing the impact of interference and noise. Single-polarization beamformers are widely used in radar systems, mobile communication base stations, and satellite communications, helping to enhance the quality and reliability of communication links, especially in complex environments or multi-user scenarios.
