## Abstracts

The global Unmanned Water Surface Robot market size is expected to reach \$ 3501 million by 2032, rising at a market growth of 11.7% CAGR during the forecast period (2026-2032).

Unmanned Water Surface Robots (UDS) are intelligent vessel systems that navigate on water without human crew, achieving autonomous decision-making and navigation through remote control or artificial intelligence algorithms. Their core components include a hull platform, power system, communication system, navigation and positioning system, multi-source sensors, and autonomous control software. Capable of performing tasks in complex marine or inland waterway environments, they are essentially an extension and industrial application of autonomous driving technology in water-based scenarios.

The Unmanned Water Surface Robot industry chain can be divided into three levels: upstream core components, midstream complete machine manufacturing and system integration, and downstream application services. The upstream mainly includes suppliers of sensors, navigation and positioning modules, communication equipment, chips and embedded systems, and propulsion systems. The midstream consists of complete machine manufacturers and system integrators. The downstream comprises application and operation services, including military security, marine surveying, environmental monitoring, port inspection, energy inspection, and data service companies. The industry is upgrading from a 'selling equipment' business model to a 'equipment + data + service' model.

The Unmanned Water Surface Robot industry is transitioning from early application verification to large-scale commercial deployment. Driven by multiple factors such as

the expansion of the global marine economy, the upgrading of unmanned defense, the maturity of artificial intelligence and communication technologies, and rising labor costs, its application scenarios are constantly expanding and extending towards higher added value. In the future, it will evolve from a single device into a 'marine intelligent network node' and form a collaborative system with drones and unmanned underwater vehicles (UUVs). In the long term, it has the potential to become a marine data entry point and infrastructure, but in the short term, it is still constrained by bottlenecks such as regulatory systems, reliability in complex environments, and communication stability.
