According to our (Global Info Research) latest study, the global Upcycled Food Products market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Food waste is a complex issue that affects every aspect of our food system. According to ReFED, over 35 million tons of food are wasted every year, costing our economy over \$218 billion. This waste also has a significant environmental impact, accounting for approximately 8% of global greenhouse gas emissions. Inefficiencies in the supply chain contribute up to 10% of food waste. Improving planning, tracking, and collaboration across the supply chain can help reduce this waste. Another key driver of food waste is consumer behavior. It's estimated that up to 20% of food is wasted at the consumer level, due to factors such as overbuying, improper storage, and confusion over expiration dates. Addressing these issues through education and awareness campaigns, as well as improved labeling and packaging, can help to reduce food waste at the consumer level.

Upcycled food is a solution to food waste that is gaining momentum. By transforming food byproducts, surplus, and scraps into nutritious and tasty products, upcycling reduces waste, saves resources, and promotes a more sustainable food system.
