Abstracts

According to our (Global Info Research) latest study, the global Upper Extremities market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The upper extremity is the region in a vertebrate animal extending from the deltoid region up to and including the hand, including the arm, axilla and shoulder.

One of the primary drivers for this market is the gradual rise in the incidence of accidental injuries. It has been observed that the cases of injuries especially road traffic injuries are increasing over the last decade. Consequently, road accidents can lead to injury in upper extremity regions, which requires bone repair products to fix it. Another significant cause of injury in upper extremity is observed in sports injuries. Sports injuries can lead to injury in the hand and wrist, which involve complex treatment procedures as it involves both the skeleton and soft tissues. It can lead to a complex tear in the dorsal and palmar radioulnar ligaments and fracture in the carpal, which are common sports injuries. Such growing incidences of accidental injuries (road accidents and sports injuries) can increase the need for upper extremity products such as bone repair and soft tissue fixation devices, which in turn will propel the growth of the global upper extremities market during the forecast period.
