Upper-limb powered exoskeleton robots are wearable robotic devices designed to assist people with upper limb impairments in performing daily activities. These robots typically consist of a combination of sensors, motors, and control systems that work together to provide mechanical support to the arms and hands. Upper-limb powered exoskeleton robots are commonly used in rehabilitation settings to help patients regain mobility and independence. They can be programmed to assist with specific tasks, such as reaching or grasping objects, and can be adjusted to accommodate the user's range of motion and strength. In addition to rehabilitation applications, upper-limb powered exoskeleton robots are also being developed for use in industrial and military settings. They can be used to help workers perform physically demanding tasks with less risk of injury, and can enhance the capabilities of soldiers in the field.
