UPVC (unplasticised polyvinyl chloride) is a form of plastic commonly used for building projects. It is created from a hard and inflexible material and these qualities make it suitable for application in installments such as pipework and window frames.

uPVC windows use a plastic powder called uPVC (unplasticized polyvinyl chloride) to create the window frame. First, uPVC is heated to a certain temperature and injected into the mold to form it. After it is injected into the mold, it is then cut along with the other components and ready for assembly in the window. The high heat insulation, noise reduction and weather resistance properties of uPVC windows are unmatched by ordinary windows. uPVC windows require little maintenance but retain their strength, color and functionality for a long time.
