According to our (Global Info Research) latest study, the global Upward Discharge Valve market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Upward discharge valve is a special valve, which is mainly used for the bottom discharge of containers such as storage tanks or reactors. Its characteristic is that the opening and closing of the valve is achieved by the rise and fall of the valve disc, and the rise of the valve disc is achieved by the connection between the valve stem and the transmission mechanism. The valve disc of the upward discharge valve is usually made of wear-resistant and corrosion-resistant materials to ensure that there will be no excessive wear and leakage during the discharge process. At the same time, the sealing performance of the valve is also very important. It needs to ensure that the leakage of the medium can be completely prevented in the closed state.

During operation, the valve disc of the upward discharge valve will move up and down along the sealing surface of the valve seat to realize the opening and closing of the valve. When it is necessary to discharge, the transmission mechanism will drive the valve stem to rise, drive the valve disc to leave the valve seat, and allow the medium to flow out. When the discharge is completed, the transmission mechanism drives the valve stem to descend again, so that the valve disc fits tightly with the valve seat again, thereby realizing the closure of the valve.

The upward discharge valve has the advantages of simple structure, convenient operation, and reliable sealing. It is widely used in storage tanks and reactors in the petroleum, chemical, pharmaceutical and other industries. At the same time, because its opening and closing process is relatively smooth and the impact on the container is small, it is also suitable for some occasions with special requirements for the discharging process.
