According to our (Global Info Research) latest study, the global Urban Solid Waste Recycling Services market size was valued at US\$ 4219 million in 2025 and is forecast to a readjusted size of US\$ 6799 million by 2032 with a CAGR of 7.0% during review period.

Urban solid waste recycling services are an environmental service primarily involving the sorting, processing, and reuse of recyclable materials from municipal waste. Through modern waste sorting technologies, material sorting, and processing equipment, recyclable materials such as paper, metals, plastics, glass, and organic matter from solid waste are extracted for reprocessing or direct recycling.

These recyclables not only reduce the environmental burden but also transform into secondary resources, reducing the demand for raw materials and minimizing environmental pollution from landfills and incineration. The recycling service supply chain encompasses everything from waste collection, sorting, and transportation to final processing and resource recovery. Service providers typically collaborate with local governments, environmental agencies, and industrial enterprises to form a closed-loop waste management system.

With increasing global environmental awareness and the demands for sustainable development, the market demand for urban solid waste recycling services will continue to grow. Downstream consumption primarily comes from urban waste sorting and recycling companies, while upstream raw material consumption is concentrated in the waste collection and transportation stages. With strengthened policy support and technological advancements, this service will play an even more important role in the

future, particularly in developing regions where the market potential is enormous.

The urban solid waste recycling service market is experiencing rapid growth, primarily driven by increased global environmental awareness, rising demand for resource recycling, and government policy support. With accelerating urbanization, the amount of urban solid waste is increasing annually, making effective waste management a crucial issue for governments and businesses worldwide. Waste recycling not only reduces dependence on natural resources but also effectively mitigates environmental pollution from landfills and incineration, playing a vital role in promoting a green economy. Therefore, more and more cities are implementing waste sorting and strengthening their recycling systems to promote efficient waste recovery and reuse.

With technological advancements, particularly breakthroughs in waste sorting and resource recovery technologies, the efficiency and precision of urban solid waste recycling services are continuously improving. The application of these technologies not only makes waste recycling more efficient but also facilitates the transformation of waste into valuable resources, such as reprocessing recycled plastics, metals, and paper for industrial use. Furthermore, increasingly stringent policies and regulations, especially in the EU and North America, have led to stricter environmental requirements, expanding the market space for waste recycling and reuse.

In summary, with the growing acceptance of green development concepts, the market prospects for urban solid waste recycling services are very promising. Especially in developing countries and emerging markets, the waste recycling market still has enormous growth potential due to inadequate waste treatment facilities. In the future, with the promotion of more intelligent and automated recycling technologies, the entire industry will move towards greater efficiency and sustainability, providing greater business opportunities for environmental protection and resource conservation.
