## Abstracts

The global Urea Nitrogen Fertilizer market size is expected to reach \$ 51786 million by 2032, rising at a market growth of 0.1% CAGR during the forecast period (2026-2032). Urea nitrogen fertilizer is a chemical nitrogen fertilizer with urea as its main component and nitrogen as its effective nutrient. It is characterized by its high nitrogen content (approximately 46%), good water solubility, and wide applicability to a wide range of crops, making it one of the most widely used nitrogen fertilizers globally. After being applied to the soil, urea is gradually hydrolyzed into ammonium nitrogen and nitrate nitrogen by urease, which are then absorbed and utilized by crops. Urea can be flexibly applied as a base fertilizer or top dressing, suitable for food crops, cash crops, and horticultural crops. It is a crucial basic fertilizer for ensuring stable and increased crop yields in modern agriculture. In 2025, the global demand for urea nitrogen fertilizer was approximately 132.11 million tons.

As one of the most widely used and industrialized nitrogen fertilizers in the global agricultural system, urea nitrogen fertilizer has always played an irreplaceable and fundamental role in ensuring food security and supporting stable and increased agricultural production. With its high nitrogen content, strong applicability, and flexible application methods, urea nitrogen fertilizer has long occupied a core position in the global nitrogen fertilizer consumption structure. Even against the backdrop of continuous adjustments in the structure of agricultural inputs, its market position remains stable and exhibits new structural evolution characteristics.

From a product attribute perspective, urea nitrogen fertilizer is a typical high-concentration nitrogen fertilizer that can be applied directly to farmland or used as an important raw material for compound fertilizers, slow-release fertilizers, and functional nitrogen fertilizers. Its nitrogen release process is completed through soil moisture and microbial action, making it suitable for various crops and different soil conditions, possessing extremely strong versatility. This characteristic determines that urea

nitrogen fertilizer has a high 'foundational' attribute in the global agricultural production system, serving as a prerequisite for the implementation of various efficient fertilization technologies.

From the market demand side, the consumption of urea nitrogen fertilizer is highly correlated with global grain planting area, crop structure, and agricultural production methods. In developing countries, food security and yield improvement remain core objectives, keeping the demand for urea nitrogen fertilizer rigid. In developed economies, although total fertilizer application is stabilizing, precision fertilization, formula fertilization, and efficiency-enhancing technologies are improving nitrogen fertilizer utilization, driving urea products towards higher efficiency and functionality. Consequently, the urea nitrogen fertilizer market exhibits a development characteristic of 'stable total volume and optimized structure.'

From the supply side, the urea nitrogen fertilizer industry is significantly dependent on energy and resources, with its production costs highly correlated with the prices of upstream raw materials such as coal and natural gas. Differences in energy endowments across regions have led to variations in production routes and cost structures. In recent years, against the backdrop of continuously increasing environmental constraints and energy efficiency requirements, outdated production capacity has been gradually phased out, while advanced large-scale plants have accelerated their commissioning, driving the global urea nitrogen fertilizer industry towards large-scale, intensive, and integrated development, resulting in a steady increase in industry concentration.

At the product upgrading level, traditional ordinary urea is gradually being combined with technologies such as slow-release, controlled-release, and humic acid compound urea, forming a multi-tiered urea nitrogen fertilizer product system. These products, by delaying nitrogen release and reducing volatilization and leaching losses, improve crop absorption efficiency while reducing the frequency of fertilization, aligning with the development direction of 'reducing fertilizer use while increasing efficiency' and green agriculture. Urea nitrogen fertilizer is transforming from a single commodity to a comprehensive solution, reshaping its market value structure.

From a regional perspective, Asia remains the core region for global urea nitrogen fertilizer production and consumption, with China wielding significant influence in terms of production capacity, supply chain integrity, and market regulation capabilities. The Middle East and Russia, relying on low-cost energy, possess strong competitive advantages in international trade. The global urea nitrogen fertilizer trade pattern is significantly affected by energy prices, policy regulation, and transportation costs, with regional supply and demand relationships constantly and dynamically adjusting. Looking ahead, the development of the urea nitrogen fertilizer market will focus more on efficiency improvement, environmental friendliness, and product structure upgrading. In

agriculture, ordinary urea will develop in synergy with high-efficiency fertilization technologies, and the proportion of functional urea will continue to increase. In industry, changes in energy structure and low-carbon requirements will drive continuous optimization of production processes. Overall, urea nitrogen fertilizer is not entering a period of decline, but rather, against the backdrop of agricultural modernization and green transformation, it is moving towards a new development stage characterized by 'high efficiency, high added value, and sustainability'.
