Uric acid-lowering drugs are medications used to manage conditions like gout, where elevated levels of uric acid in the blood lead to painful joint inflammation. These drugs work by either inhibiting the production of uric acid or enhancing its excretion from the body. Commonly prescribed medications include xanthine oxidase inhibitors such as allopurinol and febuxostat, which decrease uric acid production by blocking enzymes involved in its synthesis. Another class, uricosuric agents like probenecid, increase uric acid excretion by inhibiting its reabsorption in the kidneys.
