Abstracts

According to our (Global Info Research) latest study, the global Urolithin market size was valued at US\$ 254 million in 2024 and is forecast to a readjusted size of USD 448 million by 2031 with a CAGR of 8.1% during review period.

Urolithins are a class of compounds produced by intestinal microorganisms after metabolizing certain plant components (such as tannic acid and certain polyphenols). They are believed to have a variety of biological activities, including antioxidant, anti-inflammatory and potential anti-cancer properties. Urolithin is divided into two types: Urolithin A and Urolithin B. Urolithin A is a natural product that can be obtained by hydrolyzing tannic acid in plants such as strawberries and pomegranates. In recent years, studies have found that urolithin A has multiple functions, including promoting muscle cell growth and metabolism, reducing oxidative stress, and relieving inflammation, and has been shown to be beneficial for improving human health, especially for the health of the elderly and delaying aging and related muscle degeneration and neurodegenerative diseases. At present, this beneficial natural product is under further research and development. Through refined manufacturing and product positioning, the preparation of urolithin A can help consumers provide better health protection.
