Abstracts

The global Used Car Tire Recycling market size is expected to reach \$ 6578 million by 2032, rising at a market growth of 3.4% CAGR during the forecast period (2026-2032).

Used car tire recycling refers to the resource-based treatment process of collecting, sorting, cutting, crushing, separating steel wires and fibers, processing rubber powder/granules, preparing recycled rubber, and pyrolysis or energy utilization of used car tires that have reached their service life, are no longer safe to drive, or are no longer suitable for retreading. This transforms used tires from solid waste into secondary resources that can re-enter the rubber, road, building materials, energy, and chemical industry chains. The upstream sector mainly includes waste tire recycling networks, auto repair and tire shops, fleets, end-of-life vehicle dismantling companies, logistics and recycling systems, crushing equipment, magnetic separation equipment, screening equipment, cryogenic pulverizing equipment, pyrolysis furnaces, and environmental treatment facilities. The midstream sector involves waste tire collection, testing and sorting, dismantling and crushing, steel wire and fiber separation, rubber powder refining, pyrolysis, and product quality control. The downstream sector serves road engineering, sports fields, rubber products, building materials, cement, energy, carbon black, chemicals, and tire companies. Gross profit margins range from approximately 20% to 35%.
