According to our (Global Info Research) latest study, the global Used Engine Oil Recycling market size was valued at USD 2385.8 million in 2022 and is forecast to a readjusted size of USD 3482.3 million by 2029 with a CAGR of 5.6% during review period.

Waste engine oil recycling is restricted by many factors, including the following aspects:

Imperfect recycling system: At present, the waste engine oil recycling system is not sound enough and lacks effective management systems and supervision mechanisms. This has led to some criminals using illegal means to recycle and process used engine oil, which has had a negative impact on the entire recycling industry.

High recycling costs: The recycling of used engine oil requires a lot of manpower, material and financial resources, including transportation, storage, processing and reuse, which all require a certain cost. At the same time, since the output of waste engine oil is relatively small, the cost of recycling is also increased.

Insufficient technical level: At present, the technical level of waste engine oil treatment and reuse needs to be improved, and there is a lack of efficient, environmentally friendly, and practical treatment methods and equipment. As a result, some recycled waste engine oil cannot be effectively reused, and may even cause secondary pollution to the environment.

Insufficient social awareness: Some companies and individuals have insufficient awareness of the hazards of waste engine oil and the importance of disposal. They lack

environmental awareness and social responsibility, and often discard or discharge waste engine oil at will, causing great harm to the environment.

Illegal acquisition and disposal: Because used engine oil has a certain economic value, some companies and individuals will illegally acquire and dispose of used engine oil, causing real recycling companies to be unable to obtain sufficient resources, which will have an impact on the entire recycling industry.

Unbalanced regional development: The economic development of different regions is unbalanced. Some developed areas attach greater importance to the recycling and processing of waste oil, while the recycling and processing of waste oil in some less developed areas lags behind, resulting in a low recovery rate of waste oil in these areas. .

To sum up, waste oil recycling work is subject to many constraints. It requires the government, enterprises and individuals to work together to strengthen management and supervision, improve technical levels and social awareness, and jointly promote the development of the waste oil recycling industry.
