An intrauterine device (IUD) is a contraceptive device inserted into the uterus to prevent pregnancy. It is a T-shaped device made of plastic and contains copper or hormones. The device is inserted into the uterus by medical professionals to play a role by preventing the fertilization of eggs or the implantation of zygote. The working principle of copper intrauterine devices is to release copper ions, which are toxic to sperm and hinder fertilization. Hormone type intrauterine devices work by releasing progesterone, thickening cervical mucus and preventing sperm from entering the egg. The design of a uterine intrauterine device conforms to the shape of the uterus and helps to reduce the risk of expulsion or displacement. This is a long-term contraceptive method that can prevent pregnancy within a few years, depending on the type of device used. Although intrauterine device (IUD) is a very effective contraceptive method, it is not suitable for everyone. Women with certain diseases, such as pelvic inflammatory disease or uterine abnormalities, may not be able to use intrauterine devices. It is important to consult medical professionals to determine whether an intrauterine device is the right contraceptive choice for you. Overall, intrauterine devices (IUDs) are a safe and effective contraceptive choice that can provide long-term contraceptive protection. Its high efficiency and low maintenance requirements make it a popular choice for many women.
