According to our (Global Info Research) latest study, the global UV Absorbers market size was valued at USD 883.7 million in 2023 and is forecast to a readjusted size of USD 1204.7 million by 2030 with a CAGR of 4.5% during review period.

An ultraviolet absorber or UV absorber is a material that is used to dissipate ultraviolet light into a lower energy state. They are typically used to protect polymers by preventing the harmful ultraviolet light from degrading the polymer.

Ultraviolet absorbers have many different material compositions, including:

Benzotriazole is a common ultraviolet absorber for polyvinyl chloride (PVC).

Cyanoacrylate is a common absorber for adhesives.

Benzophenone is commonly used as an ultraviolet absorber for many different types of plastics.

There is a difference between ultraviolet absorbers and hindered amine light stabilizers. Hindered amine light stabilizers 'hinder' the negative effects that ultraviolet light can have on a material, whereas ultraviolet absorbers actually absorb the ultraviolet light and release the energy in the form of heat.
