Abstracts

According to our (Global Info Research) latest study, the global UV COD Analyzer market size was valued at US\$ 90.55 million in 2025 and is forecast to a readjusted size of US\$ 149 million by 2032 with a CAGR of 7.3% during review period.

In 2025, global sales of UV COD Analyzer reached approximately 16,000 units, with an average selling price of about USD 5,500 per unit. The gross margin of major manufacturers was generally around 30%-45%.

UV COD Analyzer is a type of water quality monitoring instrument based on ultraviolet absorption. It usually detects the organic matter absorption characteristics of water samples using ultraviolet light around 254 nm or multi-band ultraviolet spectroscopy, and then converts the signal into COD concentration through algorithm models. Compared with traditional potassium dichromate digestion COD analyzers, UV COD Analyzer does not require high-temperature digestion or large amounts of chemical reagents. It features fast detection, short response time, low operating cost, low maintenance requirements, and minimal chemical waste generation. It is suitable for continuous online monitoring scenarios such as wastewater treatment, industrial wastewater discharge, surface water environmental monitoring, and drinking water source early warning.

Its upstream components mainly include UV light sources, spectroscopic detectors, optical windows, flow cells, sensor probes, data acquisition modules, automatic cleaning components, controllers, and algorithm models. Among them, UV light source stability, optical channel anti-fouling capability, and compensation algorithms directly affect measurement accuracy. Downstream applications mainly include wastewater treatment,

industrial wastewater discharge, surface water environmental monitoring, drinking water source monitoring, and water supply early warning.
