Abstracts

The global UV-Curable Optical Bonding Adhesive market size is expected to reach \$ 1223 million by 2032, rising at a market growth of 8.1% CAGR during the forecast period (2026-2032).

A UV-Curable Optical Bonding Adhesive is a liquid or paste-form bonding material designed to join transparent optical substrates or precisely position optical components through polymerization initiated by ultraviolet or ultraviolet-visible light.

The adhesive may be placed directly in the optical path between a display, touch sensor, cover lens, glass plate, plastic lens, prism, filter, waveguide, fiber, photonic chip or other optical component. It therefore requires controlled optical transmission, haze, refractive index, color stability and long-term resistance to heat, humidity and light exposure.

Depending on the formulation, curing may be completed solely through UV exposure or combined with visible light, heat or moisture to cure shadowed regions. Some products use UV exposure only for rapid component fixation, followed by thermal curing to achieve final mechanical and environmental performance.

The 2025 ASP is US\$118/kg, global sales volume is approximately 5,850 tons, and the estimated average gross margin is approximately 40%.

The upstream chain includes acrylic and epoxy oligomers, silicone polymers, reactive diluents, photoinitiators, adhesion promoters, stabilizers, refractive-index modifiers, inhibitors, defoamers and high-purity additives. Midstream activities include formulation design, mixing, vacuum degassing, filtration, refractive-index adjustment, optical-

transmission testing, viscosity control, low-particle filling, packaging and reliability validation. Downstream users mainly include display-panel and touch-module manufacturers, automotive electronics suppliers, camera-module manufacturers, AR/VR device manufacturers, optical-component companies, photonics and fiber-optic companies, medical-device manufacturers and industrial optical-equipment producers.

Display optical bonding remains the largest volume application. Liquid adhesive fills the air gap between the display and cover lens, reducing internal reflection and improving contrast, sunlight readability and mechanical resistance. Henkel, Momentive, Dow and 3M all provide materials specifically designed for display optical bonding.

Automotive displays are becoming a more important value segment. Automotive adhesives must withstand wider temperature ranges, long-term sunlight exposure, vibration, humidity and larger panel dimensions than many consumer displays. Low modulus and low shrinkage are particularly important for reducing mura and stress around large or curved displays.

UV curing provides process control because the adhesive remains flowable before irradiation and cures rapidly when the assembly reaches the correct position. This on-demand curing characteristic is valuable for lens alignment, camera modules and other precision assemblies.

UV-LED curing is replacing conventional mercury-vapor lamps. LED sources provide instant switching, lower heat output, longer operating life and more stable wavelength control. Adhesive suppliers are consequently optimizing photoinitiator packages for 365, 385, 395 and 405 nm sources.

Visible-light curing is expanding where plastic, coated glass or filters reduce short-wavelength UV transmission. UV/visible formulations can cure through a wider range of transparent substrates and are also easier to use in thicker optical assemblies.

Shadowed regions remain a major limitation of pure radical UV curing. Suppliers are responding with UV-plus-heat, UV-plus-moisture, cationic epoxy and delayed-cure systems. Momentive's delay-cure silicones and Permabond's UV/heat cationic epoxies are examples of products designed for areas that cannot be directly illuminated.
