Abstracts

According to our (Global Info Research) latest study, the global UV-curable Temporary Bonding Material market size was valued at US\$ 81.73 million in 2025 and is forecast to a readjusted size of US\$ 185 million by 2032 with a CAGR of 12.3% during review period.

In 2025, global sales volume of UV-curable temporary bonding materials reached 63.54 tons, with an average global price of USD 1.25 million per ton. The gross margin of major industry participants is estimated at approximately 45%–65%. UV-curable temporary bonding materials are temporary support materials used in thin wafer processing and advanced semiconductor packaging. They primarily form a stable adhesive layer through ultraviolet curing, temporarily bonding device wafers to glass carriers or silicon carriers to support wafer thinning, backside metallization, etching, cleaning, handling, and other process steps. After processing is completed, debonding can be achieved through UV exposure, UV laser release, mechanical peeling, or cleaning processes. These materials are required to deliver stable adhesion, low residue, low contamination, heat resistance, chemical resistance, and low warpage.
