Abstracts

The global UV Curing Degumming Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

The UV curing and debonding machine is a device specifically designed to release UV curing adhesive. It converts the cured adhesive into a flowing state for reprocessing or cleaning by providing appropriate ultraviolet radiation. The UV curing and debonding machine usually consists of the following main parts: 1. UV lamp: emits high-energy ultraviolet radiation, used to illuminate and cure adhesive. 2. Control system: used to control the switch and running time of the UV lamp to ensure that the glue is properly treated for debonding. 3. Conveying system: used to transport items or components that need to be unglued to ultraviolet light for unglued treatment. 4. Cooling system: used to cool items or components that have been released to prevent overheating or damage. 5. Safety protection device: including UV shielding, UV monitoring, and alarm to ensure the safety of operators. UV curing and debonding machines are widely used in industries such as electronic manufacturing, printing, optics, and medical devices to remove UV curing adhesive for repair, cleaning, or reprocessing. It can efficiently release adhesive, improve production efficiency, and reduce the risk of damage to items or components.
