Abstracts

The global UV Infection Control Device market size is expected to reach \$ million by 2032, rising at a market growth of %CAGR during the forecast period (2026-2032).

UV Light refers to Ultraviolet light which is outside the visible light spectrum between wavelength ranges of 100 nanometers (nm) to 400 nm. UV Light is classified into three wavelength ranges: UV-C from 100 nm - 280 nm, UV-B from 280 nm - 315 nm, UV-A from 315 nm - 400 nm.

Infection control used to be that washing hands and sterilizing tools and equipment with high temperature water was enough to keep patients, healthcare workers and visitors safe from viruses and bacteria. With the rise of more virulent viruses and antibiotic resistant bacteria in the last five years, healthcare providers are scrutinizing their infection prevention methods and are adopting new methods of disinfection. This is changing many providers' infection protocols as they make their best efforts to meet the new challenges that HAIs (hospital-acquired infections) present.

With independent lab tests and peer-reviewed studies validating ultraviolet-C light's ability to quickly and effectively kill germs, UVC light disinfection systems have become increasingly popular with hospitals in the last one to two years. At the same time, many well-publicized incidents of healthcare-associated infections have occurred at hospitals, which has contributed to an increase in use of UVC light disinfection in hospitals. Now, use of UVC light disinfection systems has expanded beyond inpatient settings. Other types of healthcare facilities, such as clinics, surgery centers, private practices, rehabilitation facilities and nursing homes, now are using the technology.

This report focus on the data of UV products infection control device used for medical
