Abstracts

According to our (Global Info Research) latest study, the global UV LED Collimated Exposure Light Source System market size was valued at US\$ 148 million in 2025 and is forecast to a readjusted size of US\$ 252 million by 2032 with a CAGR of 7.9% during review period.

A UV LED Collimated Exposure Light Source System is an ultraviolet exposure illumination system that uses UV LED arrays as the light source and converts the emitted light into a highly uniform and collimated beam through optical components such as collimating lenses, reflectors, light pipes, fly-eye lenses, homogenizers and filters. It is designed to provide stable exposure intensity, controlled exposure dose and a small divergence angle for photolithography, printed circuit board exposure, solder mask exposure, dry film exposure, touch panel manufacturing, display panel processing, MEMS fabrication and other photo-patterning applications. Compared with mercury lamp exposure sources, UV LED collimated systems generally offer longer lifetime, lower heat generation, faster switching, better wavelength selectivity, lower energy consumption and more precise digital control.

In 2025, global sales of UV LED Collimated Exposure Light Source System reached approximately 2,613 units, with an average global market price of around US\$ 55 K/unit. Production capacity varies significantly among manufacturers, with gross profit margins ranging from approximately 30% to 50%.
